Website UI/UX Analysis Report

URL: https://easyget-customer.pages.dev/
Analyzed: 10/31/2026, 6:49:22 AM

Executive Summary

The site has a clean visual grid and well-labeled product imagery, but there are several accessibility and semantic issues that make interactive controls and navigation confusing for assistive tech and keyboard users. Fixing the top issues (semantic roles/names, link vs button misuse, heading structure, and color contrast) will significantly improve usability and accessibility across devices.

Performance Scores

Accessibility: 68/100
UI Design: 78/100
UX: 72/100
Overall: 73/100

Issues Found (4)

[CRITICAL] Empty accessible name on critical navigation link (cart) (~15 min)

Category: accessibility | Device: all

The cart link in the header appears in the DOM/accessibility tree with an empty name, making it unlabeled to screen reader users and preventing discoverability.

SOLUTION: Give the cart link a programmatic accessible name (either visible text or aria-label/aria-labelledby). Example: <a href="... aria-label="Cart, view items in your cart"> or include a visible text node. Verify with a screen reader that the label is announced.

[HIGH] Actions implemented as links instead of buttons (~1 hour)

Category: accessibility | Device: all

Many interactive actions that modify state (e.g., Add to bag / Add to wishlist) are exposed as links in the accessibility tree instead of semantic buttons, which is misleading for assistive technology and breaks expected keyboard/ARIA behavior.

SOLUTION: Replace action <a> elements used to perform in-page actions with <button> elements (or add role="button" and appropriate keyboard handlers and ARIA attributes if replacement isn't possible). Ensure each button has a clear accessible name, appropriate type attribute, and visible focus styles; update event handlers to prevent default link navigation where applicable.

[MEDIUM] Inconsistent / duplicated heading structure and missing region landmarks (~1 hour)

Category: accessibility | Device: all

Heading levels are used (H1 then multiple identical H2s and many H3s) but repeated identical H2s and a very long flat list of H3 product headings reduce navigability for screen reader users and make it hard to jump between logical sections.

SOLUTION: Group page regions using <section aria-labelledby="..."> or landmark elements and ensure each section has a unique, meaningful heading. Collapse product lists into semantic lists (ul/li) or grids with aria-label/aria-labelledby and use consistent heading levels (H2 for section, H3 for product group titles) to create a clear hierarchy for assistive tech.

[MEDIUM] Low contrast on secondary text (old prices, metadata) and some UI elements (~2 hours)

Category: accessibility | Device: all

Some secondary information (strike-through original prices, small meta text and light-gray labels) appears to use low-contrast greys on white backgrounds which may fall below WCAG contrast thresholds for regular text.

SOLUTION: Run contrast checks (WCAG 2.1) against the intended background and raise color contrast to meet at least 4.5:1 for normal text (or 3:1 for large text). Options: darken gray tokens, increase font-weight/size for secondary text, or use a stronger neutral (e.g. #6B7280 -> a darker gray) to meet thresholds.
